What is Explicitor?

- Explicitor allows you to search through every song in your iTunes library for certain profanity / words of significance in the songs.

How do I use Explicitor?

1. Make a plain text file in a program like Text Edit (OSX) or Notepad (Windows). On each line of the file, place one word that you want the application to search for. For example:

Fuck
Shit

*** Be sure to save the text file as ".txt", and not ".rtf". The ".txt" extension assures that only what you write is saved, and not any further text formatting.*

2. Open explicitor, and hit "Load Profanity". Navigate to the text file you created before, and select it.

***For most users, step 3 *will not apply.* If you have the index file – a file that holds specific XML information about an iTunes library – for an iTunes library other than that of the account you're currently logged in to, you can follow step three. Otherwise, the application automatically loads the correct iTunes index file.

3. Select the "iTunes Music Library.xml" file of the iTunes library you wish to parse.

4. Hit "Create Cache"

**** this should take a while, depending on the size of your library ****

5. When the process is completed, you should hear a beep; this means everything went well. The results of the application's efforts will be displayed in the table on the left.

6. Songs for which lyrics could not be found are denoted with a "No Lyrics" title in the "Total Profanity" field.

Functions:

Sorting:
 - To sort the results of the application, either by ascending or descending patterns, click on the header at the top of the title for the column you want to search by.
 - EX: To sort by "Song", click on the header of the song column once to sort by ascending pattern, and twice descending.

Searching:
 - To search, enter a search term – an artist or song – into the search bar. The results will be displayed on the table.

Double Clicking:
 - If you double click on a song in the table, it'll show you the lyrics with the profane words highlighted!

Misc:
 - To load a different set of songs or profanity, select new files for the corresponding fields and hit "Create Cache" again.

Loading:

 - To load a created Explicitor archive, simply locate the ".explic" file and click on it. The resulting profanity counts and songs will be loaded into the Explicitor table!

Saving:

 - Once you've loaded a certain set of profanity through your iTunes library – a painstakingly long task – you can elect to save this output directly to a file. This allows you to instantly restore the current table without having to wait for it to get lyrics for every song again!
